IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application. An identifier indicating the status of each claim is provided.

Listing of Claims

1-8. (Canceled)

9. (Currently Amended) A portable memory device ~~of a portable type~~ comprising:

~~(a)~~ a terminal capable of being connected to an interface mounted on a host machine and capable of data input/output from/to said host machine, and

~~(b)~~ a storage element for storing data which include:

at least one of image data and audio data,

reproduction program data for said host machine to reproduce at least one of said image data and audio data, and

execution program data for said host machine to execute ~~a~~ said reproduction ~~-program in~~ using said reproduction program data and a ~~write~~ writing program to write at least one of said image data and audio data from said host machine to said storage element in response to a detection signal indicating that said host machine detects a connection of said terminal to said interface.

10. (Currently Amended) The portable memory device as described in claim 9,

wherein the host machine can activate said execution program in response to said detection

signal to read and reproduce at least one of said image data and audio data stored in said memory

element, when ~~if~~ said host machine previously stores ~~beforehand~~ at least said reproduction

program data and execution program data, and

when said terminal is connected to said interface in the state that said storage

element stores at least one of said image data and audio data.~~, said host machine activates said~~

~~execution program in response to said detection signal to read and reproduce at least one of said~~

~~image data and audio data stored in said memory element.~~

11. (Currently Amended) A recording medium for storing a computer-executable

program, the program having program code comprising:~~recorded therewith programs, said~~

~~programs~~ comprising:

~~a program for making a host machine having an interface capable of data~~

~~input/output execute said program,~~

~~said program having~~

~~(a)~~ a detecting step of detecting a detection signal indicating that a terminal of ~~a~~

the portable memory device is connected to said interface[[,]]; ~~and~~

~~(b)~~ a executing step of executing a program in a reproduction program data for

reproducing at least one of image data and audio data stored in said memory device, in response

to said detection signal; and

a ~~write~~ writing step ~~program~~ to write at least one of said image data and audio

data from ~~said~~ a host machine to said storage element.

12. (Currently Amended) The recording medium as described in claim 11,

~~wherein~~ when said terminal of said portable memory device is connected to said interface and ~~if~~

said host machine stores at least one of said image data and audio data, ~~and~~ said reproduction

program data and said execution program data before ~~said step (a)~~ the detecting step, before

executing the detecting step, said host machine is made to execute ~~before said step (a),~~ two steps

including:

~~(c)~~ ~~a~~ an outputting step of outputting at least one of said image data and audio

data to said portable memory device, and

~~(d)~~ a controlling step of controlling to output said reproduction program data and

said execution program data to said portable memory device at the same time as, during or after

the ~~step (c)~~ outputting step. ~~;~~

~~in the state that said terminal of said memory device is connected to said~~

~~interface.~~

13. (Currently Amended) A data processing system comprising:

~~(a)~~ a host machine having an interface capable of data input/output, and

~~(b)~~ a portable memory device ~~having~~ comprising:

a terminal capable of being connected to said interface, and

a storage element for storing at least one of image data and audio data,

reproduction program data for said host ~~apparatus~~ machine to reproduce at least one of said

image data and audio data, execution program data for said host machine to execute a program ~~in~~

using said reproduction program data in response to a detection signal indicating that said host

machine detects a connection of said terminal to said interface, and a ~~write~~ writing program to

write at least one of said image data and audio data from said host machine to said storage

element.

14.   (Currently Amended) The data processing system as described in claim 13,

said system further ~~having~~ comprising an external apparatus connected to said host machine via a

network,

wherein said host machine comprises a means for controlling to activate said

execution program in response to said connection detection signal and outputting via said

network at least one of said image data and audio data to said external apparatus designated by a

user beforehand, when said terminal is connected to said interface in the state that at least one of

said image data and audio data is stored in said storage element.

15.   (Currently Amended) The portable memory device as described in claim 9,

wherein said ~~write~~ writing program, executed in said host machine, displays ~~on a same display~~

an icon or a reduced image of a file of image data stored in said memory device on a same

display, and writes a selected file to said memory device.
